Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your JAVA code

All rules 632 | Vulnerability 53 | Bug 154 | Security Hotspot 36 | Code Smell 389 | Quick Fix 42

Tags | Search by name...

algorithm
Vulnerability

Server certificates should be verified during SSL/TLS connections
Vulnerability

Persistent entities should not be used as arguments of "@RequestMapping" methods
Vulnerability

"HttpSecurity" URL patterns should be correctly ordered
Vulnerability

LDAP connections should be authenticated
Vulnerability

Cryptographic keys should be robust
Vulnerability

Weak SSL/TLS protocols should not be used
Vulnerability

"SecureRandom" seeds should not be predictable
Vulnerability

Cipher Block Chaining IVs should be unpredictable
Vulnerability

Basic authentication should not be used
Vulnerability

Regular expressions should not be vulnerable to Denial of Service attacks
Vulnerability

"HttpServletRequest.getRequestedSessio should not be used
Vulnerability

Hard-coded credentials are security-sensitive

Analyze your code

Security Hotspot | Blocker | cwe cert sans-top25 owasp

Because it is easy to extract strings from an application source code or binary, credentials should not be hard-coded. This is particularly true for applications that are distributed or that are open-source.

In the past, it has led to the following vulnerabilities:

- CVE-2019-13466
- CVE-2018-15389

Credentials should be stored outside of the code in a configuration file, a database, or a management service for secrets.

This rule flags instances of hard-coded credentials used in database and LDAP connections. It looks for hard-coded credentials in connection strings, and for variable names that match any of the patterns from the provided list.

It's recommended to customize the configuration of this rule with additional credential words such as "oauthToken", "secret", ...

Ask Yourself Whether

- Credentials allows access to a sensitive component like a database, a file storage, an API or a service.
- Credentials are used in production environments.
- Application re-distribution is required before updating the credentials.

There is a risk if you answered yes to any of those questions.

Recommended Secure Coding Practices

- Store the credentials in a configuration file that is not pushed to the code repository.
- Store the credentials in a database.
- Use your cloud provider's service for managing secrets.
- If a password has been disclosed through the source code: change it.

Sensitive Code Example

```
Connection conn = null;
try {
  conn = DriverManager.getConnection("jdbc:mysql://localhost
        "user=steve&password=blue"); // Sensitive
  String uname = "steve";
  String password = "blue";
  conn = DriverManager.getConnection("jdbc:mysql://localhost
        "user=" + uname + "&password=" + password); // Sensi

  java.net.PasswordAuthentication pa = new java.net.Password
```

Compliant Solution

Hashes should include an unpredictable salt

Vulnerability

Calls to methods should not trigger an IllegalArgumentException

Bug

Unsupported methods should not be called on some collection implementations

Bug

Cast operations should not trigger a ClassCastException

```
Connection conn = null;
try {
  String uname = getEncryptedUser();
  String password = getEncryptedPass();
  conn = DriverManager.getConnection("jdbc:mysql://localhost
        "user=" + uname + "&password=" + password);
```
