Java static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your JAVA code

All rules 632 | Vulnerability 53 | Bug 154 | Security Hotspot 36 | Code Smell 389 | Quick Fix 42

Tags | Search by name...

Abstract class names should comply with a naming convention
Code Smell

Strings literals should be placed on the left side when checking for equality
Code Smell

Files should contain an empty newline at the end
Code Smell

Source code should be indented consistently
Code Smell

A close curly brace should be located at the beginning of a line
Code Smell

Close curly brace and the next "else", "catch" and "finally" keywords should be on two different lines
Code Smell

Close curly brace and the next "else", "catch" and "finally" keywords should be located on the same line
Code Smell

An open curly brace should be located at the beginning of a line
Code Smell

An open curly brace should be located at the end of a line
Code Smell

Tabulation characters should not be used
Code Smell

Functions should not be defined with a variable number of arguments
Code Smell

Methods of "Random" that return floating point values should not be used in random integer generation

Analyze your code

Code Smell | Minor | clumsy

There is no need to multiply the output of `Random`'s `nextDouble` method to get a random integer. Use the `nextInt` method instead.

This rule raises an issue when the return value of any of `Random`'s methods that return a floating point value is converted to an integer.

Noncompliant Code Example

```
Random r = new Random();
int rand = (int)r.nextDouble() * 50;  // Noncompliant way to
int rand2 = (int)r.nextFloat(); // Noncompliant; will always
```

Compliant Solution

```
Random r = new Random();
int rand = r.nextInt(50);  // returns pseudo-random value be
```
