regex

Overly complicated regular expressions are hard to read and to maintain and can easily cause hard-to-find bugs. If a regex is too complicated, you should consider replacing it or parts of it with regular code or splitting it apart into multiple patterns at least.

The complexity of a regular expression is determined as follows:

Each of the following operators increases the complexity by an amount equal to the current nesting level and also increases the current nesting level by one for its arguments:

- | - when multiple | operators are used together, the subsequent ones only increase the complexity by 1
- && (inside character classes) - when multiple && operators are used together, the subsequent ones only increase the complexity by 1
- Quantifiers (*, +, ?, {n,m}, {n,} or {n})
- Non-capturing groups that set flags (such as (?i:some_pattern) or (?i)some_pattern)
- Lookahead and lookbehind assertions

Additionally, each use of the following features increase the complexity by 1 regardless of nesting:

- character classes
- back references

If a regular expression is split among multiple variables, the complexity is calculated for each variable individually, not for the whole regular expression. If a regular expression is split over multiple lines, each line is treated individually if it is accompanied by a comment (either a Java comment or a comment within the regular expression), otherwise the regular expression is analyzed as a whole.

Noncompliant Code Example

```
if (dateString.matches("(?:(?:(?:31(\\/|-|\\.)(?:0?[13578]|1[02])\\d{1,2}|(?:28(\\/|-|\\.)(?:0?[13578]|1[02])|29(\\/|-|\\.)(?:0?[13578]|1[02])|2(\\/|-|\\.)(?:0?[13578]|1[02])|1(\\/|-|\\.)(?:0?[13578]|1[02])\\d{1,2}|(?:1|2)(\\/|-|\\.)(?:0?[13578]|1[02])\\d{1,2})\\d{1,4})$")) {
    handleDate(dateString);
}
```

Compliant Solution

```
if (dateString.matches("^\\d{1,2}([-/\\.])\\d{1,2}\\d{1,4}$")) {
    String dateParts[] = dateString.split("[-/\\.]");
    int day = Integer.parseInt(dateParts[0]);
    int month = Integer.parseInt(dateParts[1]);
    int year = Integer.parseInt(dateParts[2]);
    // Put logic to validate and process the date based on i
}
```

Exceptions

https://rules.sonarsource.com/java/RSPEC-5843

1/2

"main" should not "throw" anything  Code Smell
Track lack of copyright and license headers  Code Smell
Octal values should not be used  Code Smell
Exit methods should not be called  Code Smell
HTTP response headers should not be vulnerable to injection attacks

Regular expressions are only analyzed if all parts of the regular expression are either string literals, effectively final local variables or `static final` fields, all of which can be combined using the '+' operator.

When a regular expression is split among multiple variables or commented lines, each part is only analyzed if it is syntactically valid by itself.
