Java static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your JAVA code

- All rules 632
- Vulnerability 53
- Bug 154
- Security Hotspot 36
- Code Smell 389
- Quick Fix 42

Abstract class names should comply with a naming convention	Code Smell
Strings literals should be placed on the left side when checking for equality	Code Smell
Files should contain an empty newline at the end	Code Smell
Source code should be indented consistently	Code Smell
A close curly brace should be located at the beginning of a line	Code Smell
Close curly brace and the next "else", "catch" and "finally" keywords should be on two different lines	Code Smell
Close curly brace and the next "else", "catch" and "finally" keywords should be located on the same line	Code Smell
An open curly brace should be located at the beginning of a line	Code Smell
An open curly brace should be located at the end of a line	Code Smell
Tabulation characters should not be used	Code Smell
Functions should not be defined with a variable number of arguments	Code Smell

Catches should be combined

Analyze your code

- Code Smell
- Minor
- clumsy

Since Java 7 it has been possible to catch multiple exceptions at once. Therefore, when multiple catch blocks have the same code, they should be combined for better readability.

**Note** that this rule is automatically disabled when the project's `sonar.java.source` is lower than 7.

Noncompliant Code Example

```
catch (IOException e) {
    doCleanup();
    logger.log(e);
}
catch (SQLException e) { // Noncompliant
    doCleanup();
    logger.log(e);
}
catch (TimeoutException e) { // Compliant; block contents a
    doCleanup();
    throw e;
}
```

Compliant Solution

```
catch (IOException|SQLException e) {
    doCleanup();
    logger.log(e);
}
catch (TimeoutException e) {
    doCleanup();
    throw e;
}
```
