Search by name... 🔍

Abstract class names should comply with a naming convention

Code Smell

Strings literals should be placed on the left side when checking for equality

Code Smell

Files should contain an empty newline at the end

Code Smell

Source code should be indented consistently

Code Smell

A close curly brace should be located at the beginning of a line

Code Smell

Close curly brace and the next "else", "catch" and "finally" keywords should be on two different lines

Code Smell

Close curly brace and the next "else", "catch" and "finally" keywords should be located on the same line

Code Smell

An open curly brace should be located at the beginning of a line

Code Smell

An open curly brace should be located at the end of a line

Code Smell

Tabulation characters should not be used

Code Smell

Functions should not be defined with a variable number of arguments

Code Smell

Method parameters, caught exceptions and foreach variables' initial values should not be ignored

Analyze your code

BugMinor?

While it is technically correct to assign to parameters from within method bodies, doing so before the parameter value is read is likely a bug. Instead, initial values of parameters, caught exceptions, and foreach parameters should be, if not treated as final, then at least read before reassignment.

Noncompliant Code Example

```
public void doTheThing(String str, int i, List<String> strings) {
    str = Integer.toString(i); // Noncompliant

    for (String s : strings) {
        s = "hello world"; // Noncompliant
    }
}
```
