Spring Boot / Overview

## **Spring Boot**

You can use Spring Boot to create Java applications that can be started by using <code>java -jar</code> or more traditional war deployments.

Our primary goals are:

- Provide a radically faster and widely accessible getting-started experience for all Spring development.
- Be opinionated out of the box but get out of the way quickly as requirements start to diverge from the defaults.
- Provide a range of non-functional features that are common to large classes of projects (such as embedded servers, security, metrics, health checks, and externalized configuration).
- Absolutely no code generation (when not targeting native image) and no requirement for XML configuration.
